## **Abstract**

This study's goal is to determine the practicability of the German version of the *Foto-Interview* for children of 7 to 12 years of age. The goal- and process-oriented instrument constitutes client-centered goals and interventions with pediatric clients.

Within the quantitative, explorative study design, an online-survey was sent to professions within the German-speaking area who are using the German version of the *Foto-Interview*.

The results show that it fulfills the underlying criteria of practicability. The efforts needed to conduct the process are adequate, the children's feedback is positive and the material is applicable. All participants ( $n = 21$ ) feel that the instrument is applicable and 19 would recommend it.

The users express wishes for improvement in order to facilitate the diagnostic and therapeutic process. They evaluate the application of the German version of the *Foto-Interview* within pediatric clients as enriching for the client-therapist relationship and the children's motivation.
